

DIGIPASS as a Service for Salesforce.com

The world's most popular CRM program protected by the world's best security

PROTECT YOUR SALESFORCE.COM ACCOUNT FROM HACKERS

Salesforce is a cloud based CRM program, used by sales agents to gather precious information about customers and sales data. It is a proven CRM success with thousands of new customers signing up each month. The program bundles confidential information, such as contact data, sales details, etc.

This information may seem very interesting for hackers. As a sharp increase of phishing attacks was noticed, the protection offered by static passwords was no longer considered sufficient. Salesforce.com's end-users trust in its ability to properly secure their data and in its commitment to respect the privacy of the information they place in its systems by not giving that information to others or using it inappropriately. Therefore, all communications between the web browser and Salesforce's server are always protected using robust encryption. Furthermore, its data centers are equipped with some of the strongest physical security measures available.

SECURE ACCESS CONTROL WITHIN EVERYONE'S REACH

However, the most important aspect of your online security is access control to your data. No matter how much you've invested in security measures, password security remains the weakest link in any security infrastructure. Furthermore, companies that make use of cloud-based applications may not have the resources to build and maintain a proprietary authentication infrastructure or consider it too costly to do so for a single application. For companies who cannot benefit from a traditional authentication model, VASCO developed a cloud based authentication solution to secure access to business-critical data.

CLOUD BASED MANAGED AUTHENTICATION

DIGIPASS as a Service is VASCO's cloud based, managed authentication service: authentication is provided through an outsourced model to application service providers. It secures web applications, online portals and other systems in an efficient and cost-effective manner. The platform is redundant and scalable allowing strong user authentication for millions of users. By offering authentication as a service model, VASCO overcomes a number of issues, such as infrastructure adaptations, logistic burdens, software installation etc. Therefore, DIGIPASS as a Service allows a company to release the authentication matters and focus on its own core business.

VASCO OFFERS SECURE PROTECTION

Known to be the leader in security for banking applications, VASCO has the experience to offer the most secure, end-user friendly authenticators. With DIGIPASS as a Service for Salesforce.com, VASCO offers a standard, secure way to protect customer information at an affordable price. A company that wants to use all benefits of cloud based applications does not have to build and maintain its own authentication infrastructure. Instead, it can now choose the best online two-factor authentication solution in the market. By offering authentication as a service model, VASCO takes care of the online applications' safeguarding. All implementation and maintenance concerns are managed by VASCO.

ENHANCED USER EXPERIENCE

Using SAML technology, all you need to do is configure your Salesforce.com account to use the 'DIGIPASS as a Service' platform as the authentication server. The platform will then handle all authentication requests coming from Salesforce.com. DIGIPASS as a Service provides enhanced protection against account hacking and identity theft. End-users benefit from VASCO's state-of-the-art DIGIPASS authentication technology already used by world leading banks around the globe, hence adding banking level security to business and

consumer applications. VASCO offers a wide range of software and hardware-based DIGIPASS devices, each designed to give the best end-user experience. Authentication devices are ready for use right out-of-the-box, as they come preprogrammed.

DIGIPASS for Mobile is a software-based solution that can be deployed on Blackberry, i-Phone, Android, or any Java-based smart phone. The provisioning of the software and the encryption secrets are built-in on the 'DIGIPASS as a Service platform'. For companies who desire an even higher security level, the DIGIPASS as a Service offering is also

available with hardware DIGIPASS devices, with or without a pin pad. Hardware devices add an extra security layer to the authentication infrastructure and are tamper-proof. Additional to securing the Salesforce.com application, VASCO's DIGIPASS devices can equally be used to secure access to other online applications, your websites, your corporate network and even your VPN access.

With DIGIPASS as a Service for Salesforce.com, VASCO offers a standard, secure way to protect your customer information.
